REFERENCEPROJECT

**Bank Austria Creditanstalt AG**

**\_betasystems**

All payment transaction documents are efficiently captured at the Bank Austria Creditanstalt using 4 Kleindienst high-speed scanner/sorters from Beta Systems (formerly Kleindienst).

Using this comprehensive Beta Systems (formerly Kleindienst) scanning solution, up to 350,000 payment transaction documents can be swiftly and reliably processed at the Bank Austria Creditanstalt AG each day and simultaneously archived on microfilm. These high performance scanners offer the bank benefits such as considerably reduced capturing effort and maximum image quality for convenient electronic document processing.

## Automated payment transaction document capturing

Maximum versatility, a wide spectrum of additional functions, top performance and service-friendliness were some of the main reasons why Bank Austria Creditanstalt AG was convinced by and chose to implement Kleindienst scanner/sorters from Beta Systems (formerly Kleindienst). Since then, all domestic transaction documents are captured by 2 high-speed SC 1660 scanners while foreign payment transaction documents are processed by 2 SC 60H scanner/sorters.

Various additional functions enhance the uniqueness of this scanning system. Both scanner types create 5 different images simultaneously – grey scale images of the document front and reverse as well as black/white images gross/net with and without raster. Furthermore, the generated images are immediately archived on microfilm. A further refinement comes in the shape of integrated real time OCR-B reading of the encoded line, which enables documents to be channelled via ProSort – intelligent Beta Systems (formerly Kleindienst) scanning software – into 16 different dispenser compartments. The scanning client thus automatically composes bundles according to logical criteria and simultaneously checks their consistency.

**Ms. Monika Hans, IZV business processing, Bank Austria Creditanstalt:**  
*"With the new Kleindienst scanners we have created a perfect symbiosis with the follow-up PT application. Due to the excellent image quality of the scanners, we now achieve higher STP rates in document interpretation, faster throughput rates and have thus been able to minimise manual post processing. Moreover, the SC 60H multi-format scanner also allows us to process "non-PT-documents" which means that we were able to maximally compensate the slump in capacity utilisation caused by a general decline in domestic and foreign payment transaction volumes."*
